

Mastering digital dependencies in your own terms. A strategic priority

Controlling the Digital Sovereignty dynamics offers opportunities & needs clear direction

What choices do you make today?

External forces are changing your operating model. The contextual reality forces organizations to tighten the grip

Geopolitics

Jurisdictional exposure is now an operational risk. Loss of control is real (e.g. Cloud Act)

Technology concentration

Hyperscale dependency accelerates, AI forces digital architecture modernization

National Policies

Sovereignty as design principle is becoming enforced

Regulation moves up the chain

Compliance (NIS2, AI Act, DORA, GDPR, CADA) extend obligations into supply chains. It is no longer about internal controls alone.

Digital Sovereignty Key Dynamics

HIGH DEPENDENCY | LOW ← Level of Control → HIGH | LOW DEPENDENCY

Data Autonomy & Privacy – Who owns your data in practice? Where does it reside, and who has access?

Technological Dependency – Who really decides your strategic infrastructure roadmap? Are you too dependent?

Operational Resilience – What happens when it breaks? Can you secure operations?

Supply Chain Assurance – Do you trust who & what you depend on? Can others than yourself disrupt your services?

Key Digital Resilience Metrics Every choice shifts the balance

Direct Operational Impact

Compliance Readiness

Sustainable Technical Autonomy

Operational Continuity

Business Friction – There is no free option

Most organizations underestimate their dependency until it's too late. Digital sovereignty means actively making choices, balancing dependencies, risk & impact. Every choice has consequences

Are you aware and what are you doing next? Or will you wait until disruption forces you?

Scale AI on your terms, decide your own architecture, move when needed, respond when disrupted. If you can't: you're not in control.

**You can't optimize everything. Every choice shifts the balance.
So what are you optimizing for? What choices are you making today?**
